Vendor performance without a vendor master

Morning,

I need help with something that sounds simple but probably is not.

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

The questions I would ask in the room are:

1. What would we expect to see if internal latency is being attributed externally?
2. What evidence would instead support that third-party timeouts cluster by channel?
3. How do we rule out that repeat incidents create disproportionate customer contact?

We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds. Please work towards which supplier relationship requires evidence gathering or a formal service review. A useful output would be a working Excel file with the exception population and clear columns.

Use transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. One caution: There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Regards
