The day-end cut-off is producing two versions of the truth

Hi team,

Finance and Operations are reconciling the same activity to different days because authorisation, posting and statement dates do not always line up.

We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?

- a specific channel is posting outside the expected cut-off
- retries or reversals are being counted twice
- most breaks are timing differences

The decision is whether matching rules, cut-off times or source ownership must change. Please give us a model-ready table, data dictionary and an honest baseline.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations. Statements are only available for selected accounts and months; use them as evidence samples, not as the population denominator.

Thanks
