Payment retries need an outcome-level control

Hi team,

Payment attempts, reversals and late postings can create apparent duplicates or genuine duplicate customer impact.

We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- late settlement creates false duplicates
- some customers were debited more than once before reversal
- retries are correctly linked

The decision is the matching rule, customer-impact list and preventive control. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions. Statement evidence is available only for selected accounts; use transaction identifiers and timing for the full population.

Thanks
