Where are we paying twice to serve the same customer?

Hi,

This came up in a working session and nobody had the same definition.

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: digital journeys are resolving customer needs; customers begin digitally and finish through an assisted channel; or a small set of broken journeys creates most repeat contact.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

What we need to decide is which journeys should be fixed before another channel-adoption campaign is funded. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Thank you
