Failure reason is not root cause

Hi,

This came up in a working session and nobody had the same definition.

Operations is grouping all failed payments together even though the next action depends on the actual cause.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: mandate status or retry sequencing explains the event; third-party or bank timeout explains the event; or insufficient funds explains the event.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. We looked at a version of this before. For the May 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is the operational owner, customer message and monitoring rule for each failure family. Please bring a one-page finding note plus the underlying CSV for our own review, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. Do not infer a technical component failure beyond the error and timing fields available.

Thank you
