Before we publish, who owns this denominator?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Analytics is receiving requests that use the same business term for different populations, dates and customer relationships. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Could the answer be that an undocumented exclusion is changing the denominator? Or are we actually seeing that the teams need different metrics? I also do not want us to miss the possibility that snapshot timing creates the difference.

We looked at a version of this before. For the May 2020 review, please show what changed and whether the earlier conclusion still holds. The practical decision is the governed definition, owner, exclusions and reconciliation bridge. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context. A technically consistent definition still needs business ownership and approval.

Regards
