Which timestamp should the analysis trust?

Morning,

I need help with something that sounds simple but probably is not.

A requested analysis changes depending on whether the team starts from transaction, debit-order, account-status or customer-contact records. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

The questions I would ask in the room are:

1. What would we expect to see if one source is updated retrospectively?
2. What evidence would instead support that matching logic is joining unrelated records?
3. How do we rule out that the sources record different stages of one event?

We looked at a version of this before. For the June 2020 review, please show what changed and whether the earlier conclusion still holds. Please work towards the source precedence rule and the cases that must remain explicitly unresolved. A useful output would be a working Excel file with the exception population and clear columns.

Use transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. One caution: Do not force agreement by dropping exceptions; preserve contradictory evidence for owner review.

Regards
