Monthly snapshots are leaking later knowledge

Morning,

I need help with something that sounds simple but probably is not.

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if CDC fragments and snapshots are being combined incorrectly?
2. What evidence would instead support that records preserve true as-at state?
3. How do we rule out that closure or status fields are backfilled?

We looked at a version of this before. For the June 2020 review, please show what changed and whether the earlier conclusion still holds. Please work towards which fields need event tables, effective dating or restricted use. A useful output would be a working Excel file with the exception population and clear columns.

Use monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. One caution: Do not assume a file path date is the effective date of every field.

Regards
