ATM failure is becoming branch workload

Morning,

I need help with something that sounds simple but probably is not.

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if specific provinces show repeat access failure?
2. What evidence would instead support that customers switch to smaller withdrawals or branch contact?
3. How do we rule out that cash-bin or host issues dominate?

We looked at a version of this before. For the July 2020 review, please show what changed and whether the earlier conclusion still holds. Please work towards where contingency communication and ATM support should be prioritised. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots. One caution: The data does not contain branch cash holdings or queue time.

Regards
