Collections capacity is being spent on customers who self-cure

Hi team,

Collections wants to reduce unnecessary contact by identifying customers who usually restore the account without intervention.

We looked at a version of this before. For the July 2020 review, please show what changed and whether the earlier conclusion still holds. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Can you test these explanations rather than choosing one at the start?

- repeat NSF customers need a different treatment
- past contact creates the apparent cure
- balance recovery and payment timing identify self-cure

The decision is which accounts can receive a light-touch reminder and which need an agent. Please give us a short decision pack with no more than five slides and an attached evidence table.

You should be able to build the evidence from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations. Observed cure after contact is not proof that the contact caused it.

Thanks
