### The rejection code may be doing too much work

---

Hi,

This came up in a working session and nobody had the same definition.

Credit Risk needs to know whether recorded decline reasons are consistent with affordability, documentation and workflow evidence.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: generic reasons are masking multiple causes; channel differences indicate process inconsistency; or decline codes align with application facts.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. We looked at a version of this before. For the July 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is which policy rules, reason codes or quality checks need revision. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories. The separate rejected-account file and loan decisions represent different processes; do not merge them without a defined key and business rule.

Thank you
