The oldest issue may not be the largest one

Hi team,

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count.

We looked at a version of this before. For the August 2020 review, please show what changed and whether the earlier conclusion still holds. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Can you test these explanations rather than choosing one at the start?

- small-value cases remain open because ownership is unclear
- status updates close records without resolving the transaction
- older cases cluster in one process

The decision is the exception priority rule and escalation threshold. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Thanks
