Channel adoption after first successful use

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Product needs to define successful channel adoption as sustained useful activity rather than enrolment or one event. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that customers return to assisted channels after failure? Or are we actually seeing that first successful use predicts continued use? I also do not want us to miss the possibility that adoption differs by product and customer need.

We looked at a version of this before. For the August 2020 review, please show what changed and whether the earlier conclusion still holds. The practical decision is which onboarding journey and success metric should change. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency. Available data supports channel behaviour but not every app screen, click or abandoned session.

Regards
