### Quick question: card replacement may be solving one problem and creating another

---

Hi team,

Card Operations needs to know whether replacement cards become usable quickly and whether old-card attempts continue after reissue.

We looked at a version of this before. For the October 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- customers resume normal use quickly
- old credentials continue to generate declines
- ATM and transaction channels reflect card history differently

The decision is which reissue controls or customer messages need improvement. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. Card numbers are historical lists in the account snapshot; use issue and expiry dates to determine the active card.

Thanks
