Please trace the fee and interest exceptions

Hi,

This came up in a working session and nobody had the same definition.

A small number of fee and interest items appear difficult to trace from the transaction record to the customer-facing statement.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: the issue is statement timing; the product configuration and transaction description disagree; or reversals are not inheriting the original reference cleanly.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer. We looked at a version of this before. For the October 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is whether Finance needs a mapping correction, a posting control or a customer remediation list. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not calculate general-ledger balances; no general ledger is present.

Thank you
