Reconcile applications, booked loans and collections

Morning,

I need help with something that sounds simple but probably is not.

Risk, Lending and Reporting are counting applications, approvals, booked loans and distressed accounts from different starting populations. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if declined and withdrawn cases are mixed?
2. What evidence would instead support that workflow timing explains most differences?
3. How do we rule out that booked loans are missing from downstream repayment views?

We looked at a version of this before. For the October 2020 review, please show what changed and whether the earlier conclusion still holds. Please work towards the canonical population and exception rules for the next return. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context. One caution: Do not present this as an official regulatory return without the required regulatory taxonomy and sign-off.

Regards
