Quick question: the currency exposure needs a customer-behaviour view

Morning,

I need help with something that sounds simple but probably is not.

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if loan participations explain part of the flow?
2. What evidence would instead support that a small group of customers drives most foreign-currency activity?
3. How do we rule out that cross-border-enabled accounts are not the same as active cross-border users?

We looked at a version of this before. For the October 2020 review, please show what changed and whether the earlier conclusion still holds. Please work towards whether to improve forecasting assumptions or investigate specific flow concentrations. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. One caution: This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Regards
