Quick question: which add-ons are actually used?

Team,

Before this becomes another standing report, can we answer the real question?

Product bundles are recorded at account level, but Pricing needs to know whether customers use optional features and remain active. The possible stories are that some bundles increase service contact without increasing use, that optional products deepen activity, or that default products are mistaken for cross-sell.

We looked at a version of this before. For the December 2020 review, please show what changed and whether the earlier conclusion still holds. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide which bundle components should be retained, repriced or removed from campaigns.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; campaign design and customer responses.

Please state the limitation plainly: Product enrolment is not the same as product usage; define observable use before measuring adoption.

Thanks
