Promise-to-pay quality, not collector volume

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Could the answer be that partial payments are being treated inconsistently? Or are we actually seeing that affordable promises are kept more often? I also do not want us to miss the possibility that channel and timing affect outcomes.

We looked at a version of this before. For the December 2020 review, please show what changed and whether the earlier conclusion still holds. The practical decision is the promise definition, coaching view and model target. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Regards
