Does the model treat data quality as customer risk?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Model Risk is concerned that channel, document availability and data completeness may become proxies for customer groups rather than genuine risk. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Could the answer be that missing documents drive predictions? Or are we actually seeing that branch and digital populations differ before modelling? I also do not want us to miss the possibility that performance gaps disappear after controlling for product and income.

The practical decision is which features need restriction, monitoring or clearer business justification. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. Protected-attribute analysis must be governed and access-controlled; do not use ethnicity or gender for targeting or adverse treatment.

Regards
