Which technical failures actually harmed customers?

Team,

Before this becomes another standing report, can we answer the real question?

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone. The possible stories are that customers retry across channels and create duplicates, that a small terminal or channel group creates most harm, or that latency rises before visible failure.

We looked at a version of this before. For the February 2021 review, please show what changed and whether the earlier conclusion still holds. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide incident priority, root-cause ownership and the customer-remediation population.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions.

Please state the limitation plainly: The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thanks
