Can we isolate genuine breaks from posting delay?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Finance and Operations are reconciling the same activity to different days because authorisation, posting and statement dates do not always line up. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that most breaks are timing differences? Or are we actually seeing that retries or reversals are being counted twice? I also do not want us to miss the possibility that a specific channel is posting outside the expected cut-off.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is whether matching rules, cut-off times or source ownership must change. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; available customer bank statements. Statements are only available for selected accounts and months; use them as evidence samples, not as the population denominator.

Regards
