Which branch visits are fixing another process?

Morning,

I need help with something that sounds simple but probably is not.

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if specific communications fail to explain the next step?
2. What evidence would instead support that customers prefer branch for complex needs?
3. How do we rule out that service failures drive repeat visits?

We looked at a version of this before. For the April 2021 review, please show what changed and whether the earlier conclusion still holds. Please work towards which demand should be removed, redirected or staffed differently. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Regards
