KYC completeness and account status need one rule

Morning,

I need help with something that sounds simple but probably is not.

Regulatory Reporting needs a reproducible population of active, restricted and closed accounts with the relevant customer due-diligence fields. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if company and individual rules are being mixed?
2. What evidence would instead support that snapshot timing explains the difference?
3. How do we rule out that status changes are not applied consistently?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2021 as the new evidence point rather than recycling the earlier conclusion. Please work towards the agreed population rule, data-quality exceptions and evidence trail. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: The dataset can test completeness and consistency, not determine whether every document is authentic.

Regards
