Historical file does not always mean historical truth

Team,

Before this becomes another standing report, can we answer the real question?

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models. The possible stories are that closure or status fields are backfilled, that records preserve true as-at state, or that CDC fragments and snapshots are being combined incorrectly.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2021 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide which fields need event tables, effective dating or restricted use.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields.

Please state the limitation plainly: Do not assume a file path date is the effective date of every field.

Thanks
