Quick question: the metric is stable only because the definition keeps moving

Team,

Before this becomes another standing report, can we answer the real question?

Analytics is receiving requests that use the same business term for different populations, dates and customer relationships. The possible stories are that snapshot timing creates the difference, that the teams need different metrics, or that an undocumented exclusion is changing the denominator.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2021 as the new evidence point rather than recycling the earlier conclusion. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide the governed definition, owner, exclusions and reconciliation bridge.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context.

Please state the limitation plainly: A technically consistent definition still needs business ownership and approval.

Thanks
