Separate self-cure from successful collection

Team,

Before this becomes another standing report, can we answer the real question?

Collections wants to reduce unnecessary contact by identifying customers who usually restore the account without intervention. The possible stories are that repeat NSF customers need a different treatment, that balance recovery and payment timing identify self-cure, or that past contact creates the apparent cure.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2021 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide which accounts can receive a light-touch reminder and which need an agent.

Data available: collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations.

Please state the limitation plainly: Observed cure after contact is not proof that the contact caused it.

Thanks
