The customer table needs an access design

Hi,

This came up in a working session and nobody had the same definition.

Teams are asking for customer identity, risk, income and contact fields in broad analytical extracts.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: restricted identifiers are being copied for convenience; most use cases need derived or masked fields; or different projects require different retention and access.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the shared schema, restricted extension and audit trail. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Minimise access to identity, contact, protected and investigation fields; usefulness alone is not a lawful purpose.

Thank you
