Cash access by province and customer impact

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Could the answer be that customers switch to smaller withdrawals or branch contact? Or are we actually seeing that specific provinces show repeat access failure? I also do not want us to miss the possibility that cash-bin or host issues dominate.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is where contingency communication and ATM support should be prioritised. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots. The data does not contain branch cash holdings or queue time.

Regards
