The bank should not confuse low income with low value

Hi,

This came up in a working session and nobody had the same definition.

Compliance needs an outcome view for customers who may be more exposed to failed payments, repeated fees or difficult service journeys.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: standard contact strategies create repeat complaints; income and collections stress identify higher exposure; or channel access affects resolution.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which customer-treatment controls and monitoring indicators should be introduced. Please bring a one-page finding note plus the underlying CSV for our own review, including a few cases we can trace from source to conclusion.

The available evidence is monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; collections cases, promises to pay and recovery payments; customer contacts, complaints and suggestions. Use vulnerability indicators carefully and never use them to reduce service or exclude customers.

Thank you
