Quick question: the loan return needs a population bridge

Hi team,

Risk, Lending and Reporting are counting applications, approvals, booked loans and distressed accounts from different starting populations.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2021 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- booked loans are missing from downstream repayment views
- workflow timing explains most differences
- declined and withdrawn cases are mixed

The decision is the canonical population and exception rules for the next return. Please give us a model-ready table, data dictionary and an honest baseline.

You should be able to build the evidence from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context. Do not present this as an official regulatory return without the required regulatory taxonomy and sign-off.

Thanks
