Bundle uptake versus useful activity

Morning,

I need help with something that sounds simple but probably is not.

Product bundles are recorded at account level, but Pricing needs to know whether customers use optional features and remain active. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

The questions I would ask in the room are:

1. What would we expect to see if default products are mistaken for cross-sell?
2. What evidence would instead support that some bundles increase service contact without increasing use?
3. How do we rule out that optional products deepen activity?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2021 as the new evidence point rather than recycling the earlier conclusion. Please work towards which bundle components should be retained, repriced or removed from campaigns. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; campaign design and customer responses. One caution: Product enrolment is not the same as product usage; define observable use before measuring adoption.

Regards
