The same symptom can belong to Cyber or Operations

Hi,

This came up in a working session and nobody had the same definition.

Timeouts, host-response failures and repeated attempts can resemble malicious activity or ordinary service degradation.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: a concentrated account or terminal pattern suggests abuse; operational retries are obscuring the original event; or technical failure explains the cluster.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible. We looked at a version of this before. For the December 2021 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is the minimum evidence needed to route an alert to Cyber, Fraud, Payments or Infrastructure. Please bring a one-page finding note plus the underlying CSV for our own review, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency. This is triage design from available telemetry, not a substitute for SOC, firewall or application logs.

Thank you
