Quick question: approved, but with how much room to breathe?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Credit Risk wants to study borrowers approved close to affordability limits rather than compare only approvals and declines. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Could the answer be that verified expenses or income quality create the main uncertainty? Or are we actually seeing that product and term explain the outcome? I also do not want us to miss the possibility that thin discretionary income predicts later stress.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2022 as the new evidence point rather than recycling the earlier conclusion. The practical decision is whether policy buffers, verification or monitoring should change. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations. The analysis can observe recorded affordability inputs, not every household obligation or later income shock.

Regards
