Follow-up: which failures are really sitting with a third party?

Hi team,

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- internal latency is being attributed externally
- repeat incidents create disproportionate customer contact
- third-party timeouts cluster by channel

The decision is which supplier relationship requires evidence gathering or a formal service review. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Thanks
