A kept promise should be defined before it is measured

Morning,

I need help with something that sounds simple but probably is not.

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

The questions I would ask in the room are:

1. What would we expect to see if channel and timing affect outcomes?
2. What evidence would instead support that partial payments are being treated inconsistently?
3. How do we rule out that affordable promises are kept more often?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2022 as the new evidence point rather than recycling the earlier conclusion. Please work towards the promise definition, coaching view and model target. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. One caution: Do not rank individual collectors without workload, assignment and contact-attempt history.

Regards
