Digital volume is not the same as lower cost

Morning,

I need help with something that sounds simple but probably is not.

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

The questions I would ask in the room are:

1. What would we expect to see if customers begin digitally and finish through an assisted channel?
2. What evidence would instead support that digital journeys are resolving customer needs?
3. How do we rule out that a small set of broken journeys creates most repeat contact?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2022 as the new evidence point rather than recycling the earlier conclusion. Please work towards which journeys should be fixed before another channel-adoption campaign is funded. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Regards
