### Follow-up: which source change silently changed the business answer?

---

Hi team,

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2022 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?

- null patterns reveal a source rollout rather than missing customer data
- renamed or recoded fields break history
- new fields are additive

The decision is the data contract, quarantine rule and backfill requirement. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Thanks
