Please hold back a control group before launch

Hi,

This came up in a working session and nobody had the same definition.

Analytics has been asked to report campaign success, but selected customers may already have been more likely to convert.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: the campaign creates incremental response; service problems suppress otherwise suitable offers; or targeting explains the apparent lift.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2022 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the treatment, control, success window and guardrail measures before the next campaign launches. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is campaign design and customer responses; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. Historical campaign responses alone do not identify causal impact where no comparable control group exists.

Thank you
