Follow-up: where does cash access fail when customers need it most?

Hi team,

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2022 as the new evidence point rather than recycling the earlier conclusion. The timing also overlaps with Record Stage 6 load shedding across major metros. Treat that as context to test, not an answer. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?

- specific provinces show repeat access failure
- cash-bin or host issues dominate
- customers switch to smaller withdrawals or branch contact

The decision is where contingency communication and ATM support should be prioritised. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots. The data does not contain branch cash holdings or queue time.

Thanks
