Follow-up: who pays without a call?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Collections wants to reduce unnecessary contact by identifying customers who usually restore the account without intervention. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that balance recovery and payment timing identify self-cure? Or are we actually seeing that past contact creates the apparent cure? I also do not want us to miss the possibility that repeat NSF customers need a different treatment.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2022 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which accounts can receive a light-touch reminder and which need an agent. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations. Observed cure after contact is not proof that the contact caused it.

Regards
