Build the triage bridge between the SOC and Payments

Team,

Before this becomes another standing report, can we answer the real question?

Timeouts, host-response failures and repeated attempts can resemble malicious activity or ordinary service degradation. The possible stories are that operational retries are obscuring the original event, that technical failure explains the cluster, or that a concentrated account or terminal pattern suggests abuse.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2022 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Please prepare a short decision pack with no more than five slides and an attached evidence table. The output must help us decide the minimum evidence needed to route an alert to Cyber, Fraud, Payments or Infrastructure.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency.

Please state the limitation plainly: This is triage design from available telemetry, not a substitute for SOC, firewall or application logs.

Thanks
