Follow-up: are we seeing pass-through accounts or ordinary cash-flow behaviour?

Hi team,

Financial Crime wants to test whether rapid receipt and onward movement forms a network pattern or reflects ordinary customer behaviour.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- shared beneficiaries connect otherwise separate customers
- salary, family support or business cash flow explains the pattern
- new accounts act as pass-through accounts

The decision is which cases deserve investigation and which monitoring rule needs a better peer group. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; debit-order mandates, collection dates, suspensions and cancellations. The output is a triage hypothesis. Do not label a customer a mule without investigation and external evidence.

Thanks
