Follow-up: are we collecting on the wrong day for the customer's cash flow?

Team,

Before this becomes another standing report, can we answer the real question?

Payments wants to test whether collection timing, rather than inability to pay, explains repeat debit-order failure. The possible stories are that retry timing improves success, that collection before regular inflow drives failure, or that fixed collection rules work differently across customer groups.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2023 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide whether to test alternative debit dates or change retry logic.

Data available: debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments.

Please state the limitation plainly: Regular inflows are inferred from transaction patterns; no verified payroll calendar is available.

Thanks
