Follow-up: collections says paid; Finance still sees arrears

Hi,

This came up in a working session and nobody had the same definition.

Collections and Finance are using different notions of a successful recovery, especially when payments arrive after the promised date or through another channel.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: a payment reaches the account but not the collections case; partial cures are being reported as full cures; or late payments are being treated as broken promises.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the definition of cure and the exception queue that Finance and Collections will both use. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. The data can reconcile customer and case activity, but not the accounting ledger entry.

Thank you
