Follow-up: audit sample: activity after account closure

Hi team,

Internal Audit wants to test whether an account status change consistently stops transactions, ATM access, debit orders, collections and campaigns.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2023 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?

- manual exceptions are not documented consistently
- some downstream systems lag
- controls propagate on the same day

The decision is whether this is an isolated exception, a design weakness or a control operating failure. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments; campaign design and customer responses. The result is a data-based control test and still requires process-owner evidence.

Thanks
