Follow-up: the incident clock and the customer clock are not the same

Hi,

This came up in a working session and nobody had the same definition.

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: a small terminal or channel group creates most harm; customers retry across channels and create duplicates; or latency rises before visible failure.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is incident priority, root-cause ownership and the customer-remediation population. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thank you
