Follow-up: before we publish, who owns this denominator?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Analytics is receiving requests that use the same business term for different populations, dates and customer relationships. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Could the answer be that an undocumented exclusion is changing the denominator? Or are we actually seeing that the teams need different metrics? I also do not want us to miss the possibility that snapshot timing creates the difference.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2023 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the governed definition, owner, exclusions and reconciliation bridge. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context. A technically consistent definition still needs business ownership and approval.

Regards
