Follow-up: monthly snapshots are leaking later knowledge

Hi team,

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2023 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Can you test these explanations rather than choosing one at the start?

- records preserve true as-at state
- closure or status fields are backfilled
- CDC fragments and snapshots are being combined incorrectly

The decision is which fields need event tables, effective dating or restricted use. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. Do not assume a file path date is the effective date of every field.

Thanks
