Follow-up: audit wants the lineage, not another dashboard

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Management reports are expanding faster than the evidence showing how each number was sourced, transformed and approved. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Could the answer be that manual exclusions are changing the answer? Or are we actually seeing that the number can be reformed from source? I also do not want us to miss the possibility that different teams use the same label for different populations.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2023 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which data controls must be formalised before the next assurance review. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; customer contacts, complaints and suggestions. Do not create a full enterprise lineage claim; reperform a defined metric and document every limitation.

Regards
